# implisit auth

This method guesses that during entry into the system, you don't need to input a login and password because the application can detect your location, time, etc. Therefore, the app understands that it's you

1. User send to the authenicates server an acces token(scope, client_id, client_secret and etc.)
2. User to pass an authentication which prompted by app
3. User has gotten a token response(token id, token refresh and etc.)
4. After authentication user can to address  can api(prompted an app)
